

S.No: 3	Exp. Name: <b>Write a Java program to print the speeds of qualifying bikers in a Race</b>	Date:2023-09-04
---------	---	-----------------

### Aim:

Five bikers compete in a race such that they drive at a constant speed which may or may not be the same as the other.

To qualify the race, the speed of a racer must be more than or equal to the average speed of all the 5 racers.

Take as input the speed of each racer and print back the speeds of qualifying racers.

Write a class `Race` with a method `main(String[] args)`. The main method receives five arguments. You can write code to parse them into `double` data type.

For example, if the values `54.55, 53.57, 54, 56.25, 57.30` are passed as arguments to the `main()` method, then the output should be

The speed of the racers >= average speed 55.134 : 56.25 57.3.

**Note:** Make sure to use the `print()` method and not the `println()` method.

### Source Code:

`Race.java`

```
class Race
{
    public static void main(String args[])
    {
        double a,b,c,d,e,avg,f[],g;
        f=new double[5];
        a=Double.parseDouble(args[0]);
        b=Double.parseDouble(args[1]);
        c=Double.parseDouble(args[2]);
        d=Double.parseDouble(args[3]);
        e=Double.parseDouble(args[4]);
        avg=(a+b+c+d+e)/5;
        System.out.print("The speed of the racers >= average speed "+avg+": ");
        for(int i=0;i<5;i++)
        {
            g=Double.parseDouble(args[i]);
            if(g>avg)
            {
                System.out.print(", "+g);
            }
        }
    }
}
```

Execution Results - All test cases have succeeded!

Test Case - 1
User Output
The speed of the racers >= average speed 54.855999999999995: ,81.6,58.19,79.42

Test Case - 2
User Output
The speed of the racers >= average speed 78.0032: ,96.21,87.26,105.63
